The heavier a thing is, and the faster it moves, the more kinetic energy it has. There are two types of kinetic energy: transitional and rotational. Transitional kinetic energy depends on the motion through space, and an example would be a baseball pitcher throwing a ball. The ball contains the kinetic energy contained from the pitcher throwing the ball. On the other hand, rotational kinetic energy depends on an object's motion that is centered on an axis, like the Earth's rotation on its axis.
